Harqen Reshapes Recruiting in the Cloud

Onix helped Harqen with their move from on-premise to Google Cloud Platform (GCP). Prior to the migration, they provided planning assistance and after an architecture review. Now, Onix offers DevOps assistance as part of a managed services program.

The challenge

Harqen required a scalable, reliable and modern hosting platform. They experienced network outages with their previous data center provider. Harqen needed guidance moving their application to GCP as well as enabling autoscaling in the application. They also needed help with cloud security, including data protection. Harqen wanted to shed 24/7 monitoring and support to free up their internal staff.

The solution

Onix led the planning and after the migration conducted an architecture review and validation of the GCP environment, including Kubernetes Engine implementation, Stackdriver and Cloud Identity Access Management. Onix now provides managed services using CI/CD system management that includes configuration management and automation ensuring Harqen's GCP architecture undergoes continuous improvements.

The results

This Cloud Native App Development project enabled Harqen to release software updates faster, more reliably and safely, which improves customer experiences, application performance and resilience. Additionally, the ability to offload environment maintenance and support to Onix, as a managed services provider, enabled HarQen to shift internal resources to higher-value activities.

> **❝** We're glad to be going down this cloud journey with Onix. The team is a core part of what we're doing. **❞**
