

UISA - SAP Migration

Atos worked side-by-side with uisa to study and define what is most modern in integrated business management and associated technology. The two companies designed a solution that uses SAP S/4HANA in a public cloud architecture for Google Cloud.

The challenge

uisa was using an older version of SAP in a highly customized and integrated environment. The company's digital strategy had been transforming other parts of the organization, with smarter agricultural practices, for example. Now the digital imperative was to improve its back-office and workplace efficiencies using cloud-based systems.

The solution

uisa harnessed the efficiency and data processing power of SAP S/4HANA to provide enhanced data intelligence and transparency for logistics, supply chain and industrial systems. Its new Google Workspace platform creates a productive, connected work environment for employees anywhere, including remote worksites.

The results

With the project delivered by Atos, uisa will have the following benefits:

- Agility; • Cost reduction; • Best IT Service; • Modernization; • Accurate view of the Company's performance.

“Besides seeking to increase efficiency and agility gains through our journey of innovation, we also want to change the way of doing and thinking about technology for agribusiness.”

Rodrigo Ribeiro Gonçalves, Executive Manager of Technology, Automation and Innovation at uisa

About uisa

Headquartered in Mato Grosso, Brazil, uisa grows sugarcane and processes it into sugars and sugar by products like ethanol. uisa manages complex logistics to send its products by road and river to markets throughout central and western Brazil. The company also generates electricity from sugarcane bagasse, making it self-sufficient.

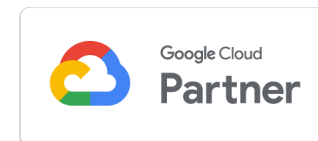

Industry: Agriculture

Primary project location: Brazil
