4intelligence Apigee Implementation

IPNET provided an Apigee instance for the client's production project, along with an API product, a developer portal and an API proxy with Quota, Spike Arrest and Cross-origin resource sharing. It was internally connected to a back-end in Cloud Run.

The challenge

4intelligence was looking for a solution that could optimize the API integration and management processes, searching for connectivity with other systems and data sources.

The solution

The solution was the implementation of Apigee, that would provide a safe and easy management way to connect with the client's APIs.

The result

Working with IPNET and Apigee, the client observed better traction of its project. Other benefits were the net traffic transparency and the API calls, and 4intelligence could also make better decisions in the development level to the volume of information they received. Security was also optimized.

> **"** "Apigee tool has been very important to 4intelligence when we think of API productization and API selling, besides the API controls, metrics and performance we have now." **"**
>
> Rafael Mendonça, CTO

About 4intelligence

4intelligence helps large companies make better decisions through an intuitive platform that allows them to build predictive models at scale, with agility and precision.
