Governance for Google Workspace

Implementation of Mobile Device Management to solve devices issues; Data Prevention Loss activation to classify and protect data; management of endpoints to connect digital environments. Processes and configurations happened in a consultative way.

The challenge

With the company's growth, the client faced issues with a great number of devices to be managed. This growth also resulted in an increase of data generation, that could lead to information sharing incidents, and governance needed to be optimized. Another issue was the number of new employees that needed to be trained in data management and compliance.

The solution

With Cloud Productivity, a Managed Service from IPNET, our team worked on the mapped challenges in the client's environment, with: the implementation of a consolidated data and device management; data classification and protection; users' support and training.

The result

BRB could observe a decrease in incidents and better efficiency in its digital ecosystem management. Improper sharing could be mitigated, with new configurations; and protection layers were created in the GWS panel, while employees were trained in its tools. The device management allowed BRB to easily realize its workflows, with a flexible and personalized IT governance.

> " "IPNET makes our journey easier! We now have an assessment that brings us a good vision, and the solution itself offers a range of possibilities. Surely, it was a huge differential (having Cloud Productivity) for us." "
>
> Igor Mota, Supervisor de TI
