

# Atlax 360 migrated to Google Cloud for a more flexible environment

In addition to a more modern and complete infrastructure for their systems, Devoteam G Cloud provided a more collaborative solution for their 300 employees.

## The challenge

Atlax 360's main need was to look for a service provider with an open environment, to be independent of the systems they were previously using. They were looking to diversify both the data infrastructure they had, and modernize the workstations for their users globally. They were looking for flexibility in systems management, power and backup that only Google Cloud could offer.

## The solution

To migrate Atlax 360's pre-production environment to Google Cloud Platform - storage, compute, servers, communications and backup. And to improve their collaboration and productivity environment, the company migrated to Google Workspace for a more participative management, in which Devoteam also offered a complete Change Management service, which included content creation and training.

## The result

The main benefits for Atlax 360 to work with Google Cloud solutions and Devoteam were having a flexible and diversified data infrastructure, more open, with the possibility of having a better control of expenses. And with the implementation of Google Workspace suite for the entire company, there was a reduction of more than 50% in costs in office automation tools.
