

Healthcare Analytics Software Development

The partner was tasked to build a robust health diagnostics software as a service based minimum viable product that uses predictive analytics for Complementary Health practitioners in the United States and Australia.

The challenge

We needed a cloud solution that was scalable, quick to deploy and and hassle free maintenance capabilities. We also needed a cloud platform that had comprehensive machine learning capabilities and tools to allow us to develop and scale potential AI usage while handling growing complexity.

The solution

A full stack app and user interface built on Google App Engine and Firebase that hosts a quick non-invasive health questionnaire, input screens and administration panels. Developed a predictive model on type 2 diabetics patient dataset trained on Google Datalab/Colab and deployed on google cloud storage and on google cloud run.

The results

A robust minimum viable product and machine learning model was built and deployed within 6 weeks for launch and trial client use.

“ The Persuasion Technologies staff are by far the easiest and most skilled that we have had the pleasure of doing business with. ”
