

Termo Spa

Huware has allowed Termo to choose the right solutions for the progressive enablement of the services necessary to achieve their objectives and to implement products such as the Google Workspace collaboration suite.

The challenge

The goal was to propose a new energy redevelopment model. Data are the basis of this new approach, as only through their analysis is it possible to offer the best portfolio of solutions to customers and at the same time guarantee a future of services for Termo itself.

The solution

Termo has found in Google Cloud the most complete platform for managing their data, which requires not only flexibility of representation but above all to be contained in a secure way and increasingly analyzed with artificial intelligence algorithms. The most used technologies from Termo are: Google Kubernetes Engine, BigQuery, DocumentAI.

The results

Termo managed to successfully prototype their sensor data analysis system and also a first set of automatic analysis systems.

“ 2023 will still be a year of strong research and development for us, but we are starting with two more certainties: that we have chosen the best Cloud platform to solve our needs and the best partner to help us do it. ”

Edoardo Bellani, CTO, Termo Spa

About Termo Spa

Italy's #1 platform for sustainable home solutions
