

## Pacer Digital

ClearObject helped develop Pacer Digital's next-generation CryoIntelligence application in 2018, as the need for a more scalable application we have partnered to further expand the capabilities of the application for easier client on-boarding.

### The challenge

Along with improving how data is ingested, processed, stored, and presented, a key objective is managing enterprise capabilities to allow customers to setup a hierarchy of users to manage and better use the application. This hierarchy will allow for easier device management and scalability across the new clients organizations.

### The solution

Like the original CryoIntelligence application, the next-generation product will be stored in Fire Store allowing the development team to create a more robust application in Firebase. While using Firebase front end we can configure user rules, notifications, and Admin rights. This solution allows for the client to much easier onboard technicians to better monitor the Application.

### The results

When we built their first application for Pacer Digital, there was an ongoing need for application modernization. As more and more customers became interested in gaining insights to the CryoFreezers, we partnered with Pacer Digital to bring on new features and allow for further scalability.

From the development of the first application and a now much more scalable application; we have successfully begun on-boarding new clients with Pacer Digital

### About Pacer Digital Systems Inc

Pacer Digital Systems, Inc. is known worldwide for providing CryoStorage sample safety & regulatory compliance through its CryoIntelligence network.

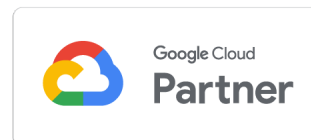

Industry: Healthcare & Life Sciences

Primary project location: United States
