STEM Learning: Google Classroom Deployment

Netpremacy helped STEM Learning to upload and manage the data they needed to support their virtual education programme using Google Admin console and Google Workspace.

The challenge
STEM Learning runs an education programme for 800+ users, including teachers, classes and students. The programme is tailored to individual needs and regions. As part of this, STEM Learning runs a virtual learning environment. Due to the variety of topics covered, the different user types and regions to consider, it's time-consuming for the team to manage the technical side of this.

The solution
On each week of the project, STEM Learning would share lists of the different types of users that needed to access their courses. Netpremacy bulk provisioned users, created classrooms and added all the relevant details to ensure the right people could access the right information at the right time. As this was handled swiftly, STEM Learning was confident any last-minute changes could be managed.

The results
STEM Learning ran a successful project helping to bring STEM subjects to 900 supervisors, 800+ students and 200+ placement providers. By outsourcing the technical side of the project, they created a seamless experience for their attendees and saved significant time by harnessing the Google APIs to script bulk actions, which meant more time for value creation and less time on maintenance.

> " It was great to work with Netpremacy again. Working with them for a second year meant they were able to bring forward historical project knowledge and successfully get things done in a very short amount of time. They have been a brilliant supplier with lovely staff; I will continue to recommend them. "
