

How Collibra added new automation features with Generative AI

Devoteam G Cloud provided their expertise in Google Cloud services and in developing innovative solutions for integrating Artificial Intelligence to enhance a companies operations and services.

The challenge

The Collibrarians working on Collibra's AI strategy understood that innovative ideas were plentiful throughout the organisation, and they aimed to use this collective intelligence quickly. The challenge was activating all Collibrarians, regardless of their role, to contribute to their next-generation AI capabilities.

The solution

Devoteam G Cloud organised a hackathon to foster AI innovation within Collibra. The company was divided into multiple teams, each consisting of technical and business profiles. They then chose a use case to tackle based on the challenges their customers experience. Using Generative AI on Vertex AI, they produced several prototypes within 48 hours, showcasing innovative uses of AI for Collibra.

The result

The hackathon exceeded expectations and Collibrarians from around the world participated virtually or in person. During the hackathon, participants were able to implement solution prototypes in only 48 hours. This allowed them to showcase the value of generative AI to the other Collibrarians. The hackathon yielded 3 major automation features that are now implemented and being used by customers.

“ We have a lot of work still to do with Devoteam G Cloud. We have a 1000 ideas blooming that will need to be put in production. ”

Stijn Christiaens - Co-founder & Chief Data Citizen at Collibra
